## 1. EXECUTIVE SUMMARY & STRATEGIC OVERVIEW

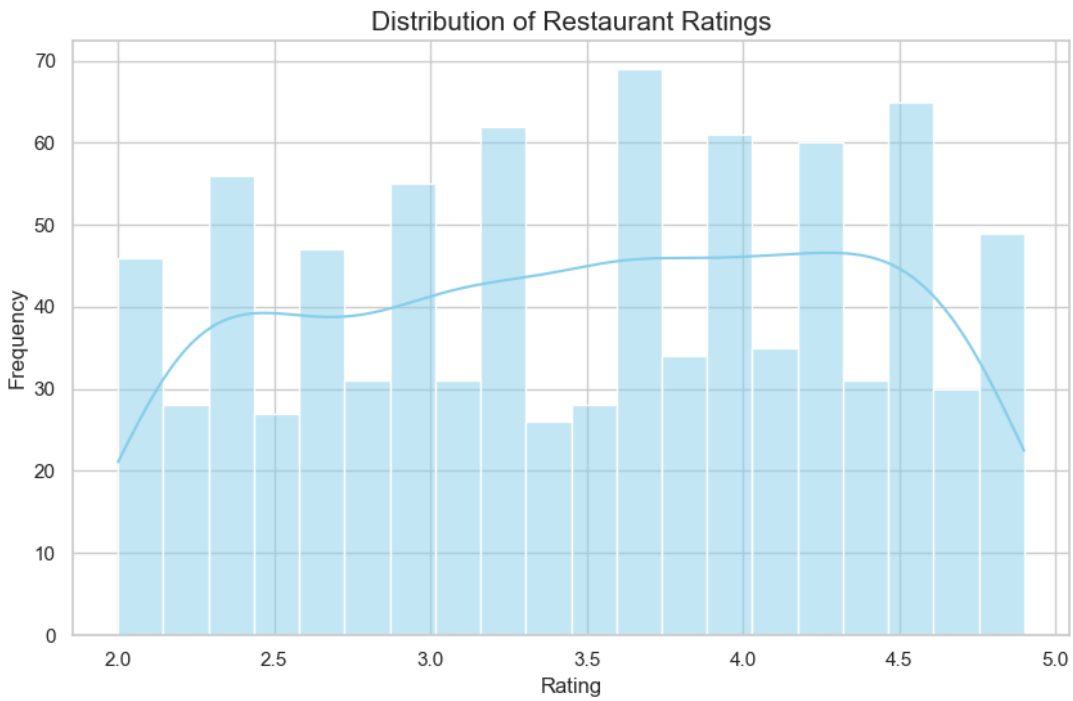
**Overview:**

This report presents a clinical analysis of 1000 restaurant entities in Bangalore. The objective is to decode the drivers of customer satisfaction and market positioning. Key Metrics: Avg Rating (3.49), Avg Cost/Two (1337.56 INR).

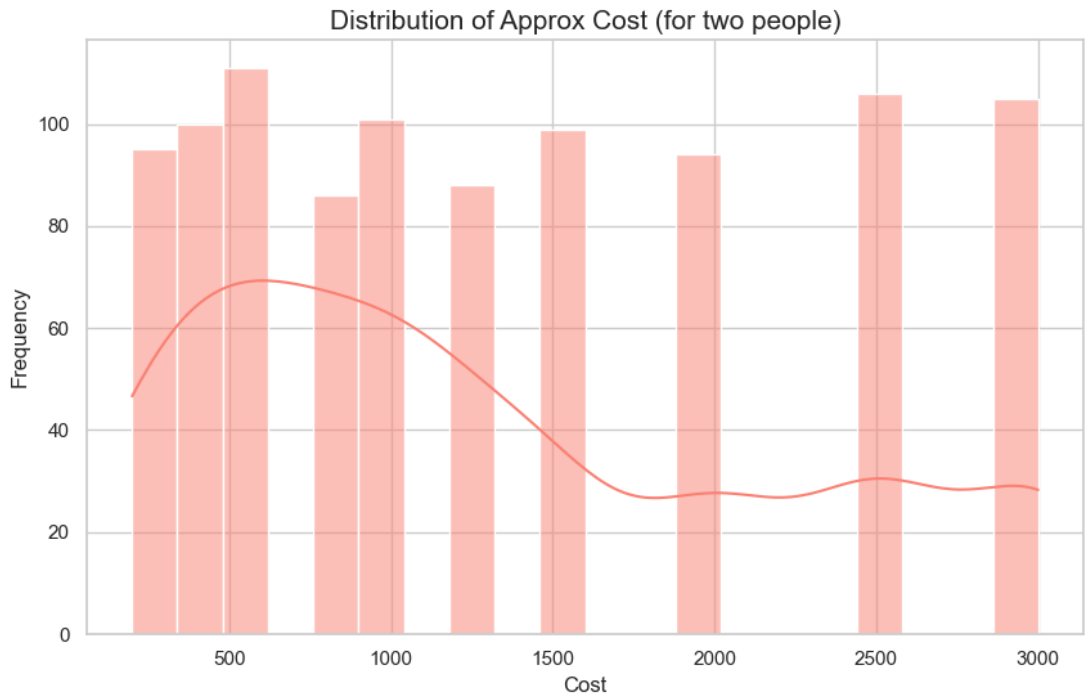
Strategic High-Level Inferences:

- Engagement as a Proxy for Quality: High rating reliability is anchored in engagement volume (Votes).
- Price Sensitivity: The market is heavily concentrated in the sub-1000 INR price point, indicating a value-driven consumer base.
- Digital Maturity: Service features like Online Ordering are no longer 'perks' but operational imperatives for rating stability.

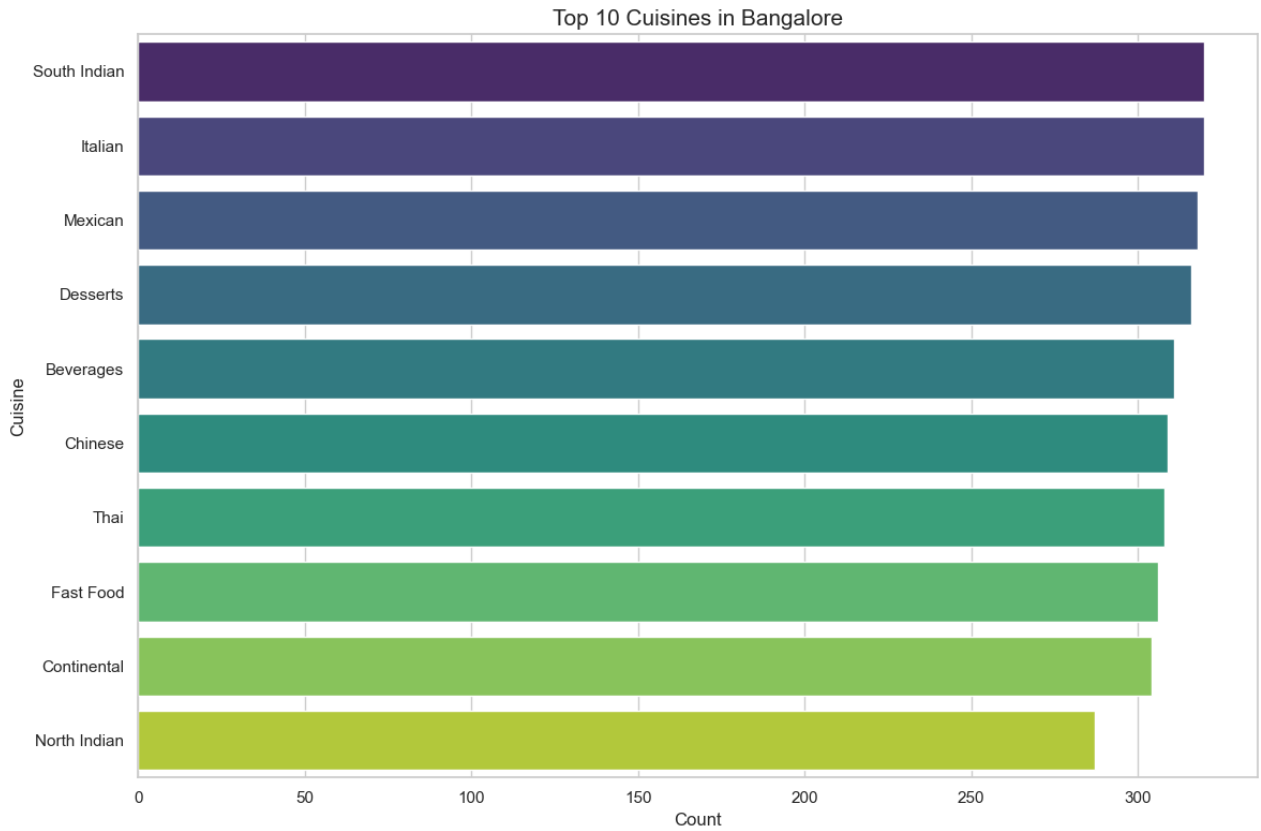
## 2. UNIVARIATE ANALYSIS: RAW DISTRIBUTIONS



INFERENCE: The ratings follow a near-normal distribution skewed towards 3.5. Competition is high in the mid-range (3.2-3.8), meaning restaurants must over-deliver to break into the 4.0+ 'Premium' tier.



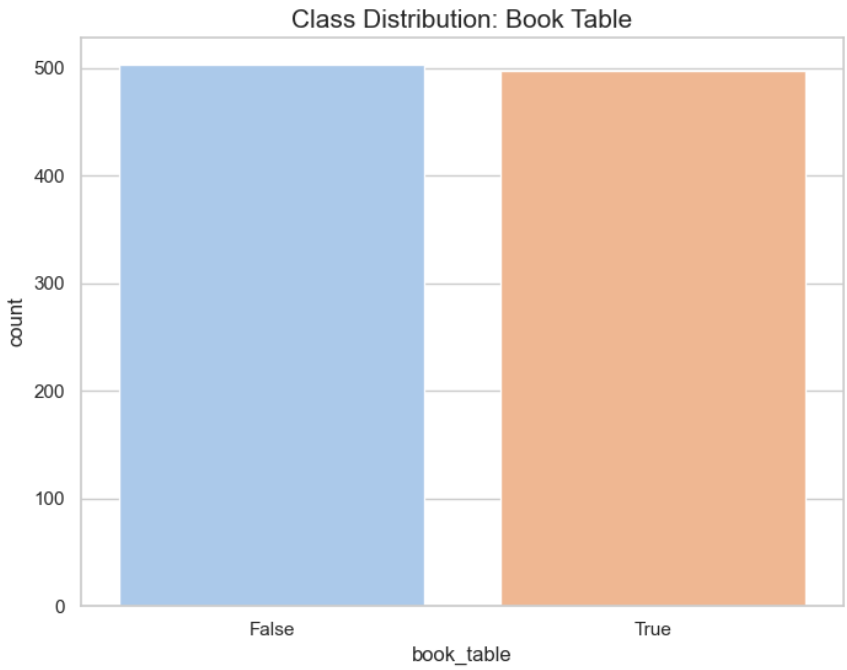
INFERENCE: Massive concentration in the 400-800 INR bracket. Scaling for mid-to-high cost ventures requires a very distinct value proposition to justify the 'Price Premium' to cost-conscious Bangaloreans.



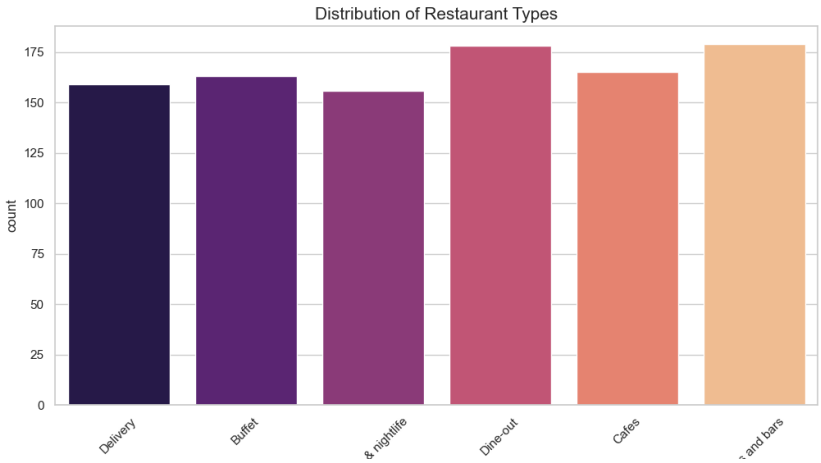
INFERENCE: North Indian and Chinese are staples. Market entry in these segments requires efficiency; niche cuisines show lower count but may have untapped loyalty potential.

## SECTION 2.1: OPERATIONAL CLASS IMBALANCES

INFERENCE: High online order adoption indicates a delivery-heavy market. Entities without online presence are likely losing 60%+ market reach.

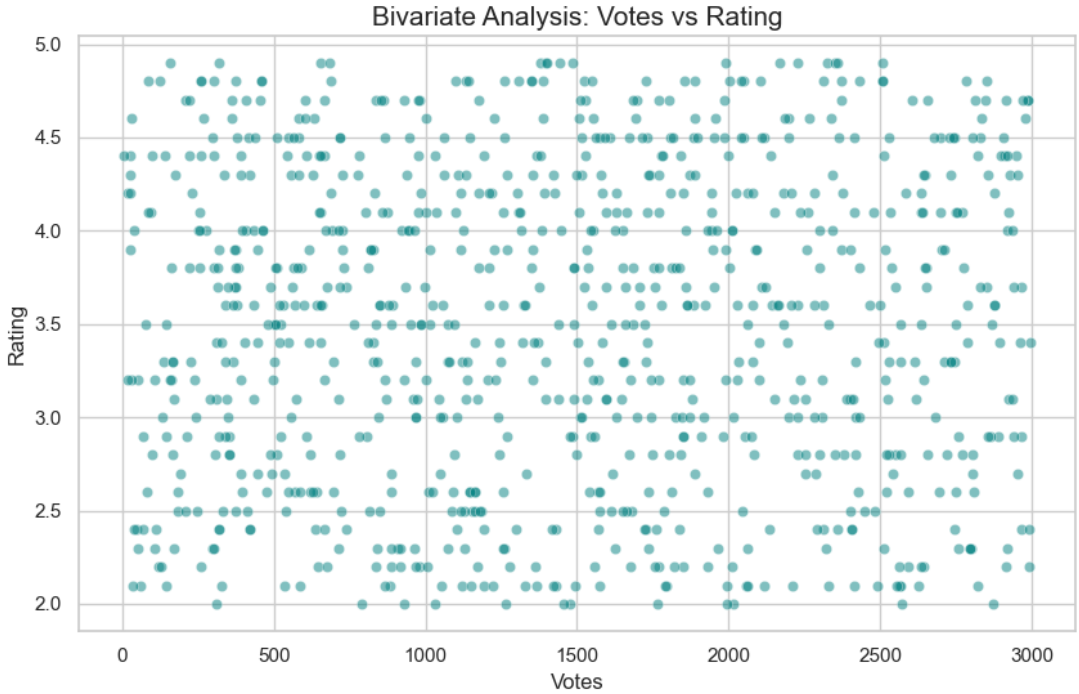


INFERENCE: Table booking remains a 'Fine Dining' niche. Most restaurants focus on quick turnaround and high-volume casual customers.

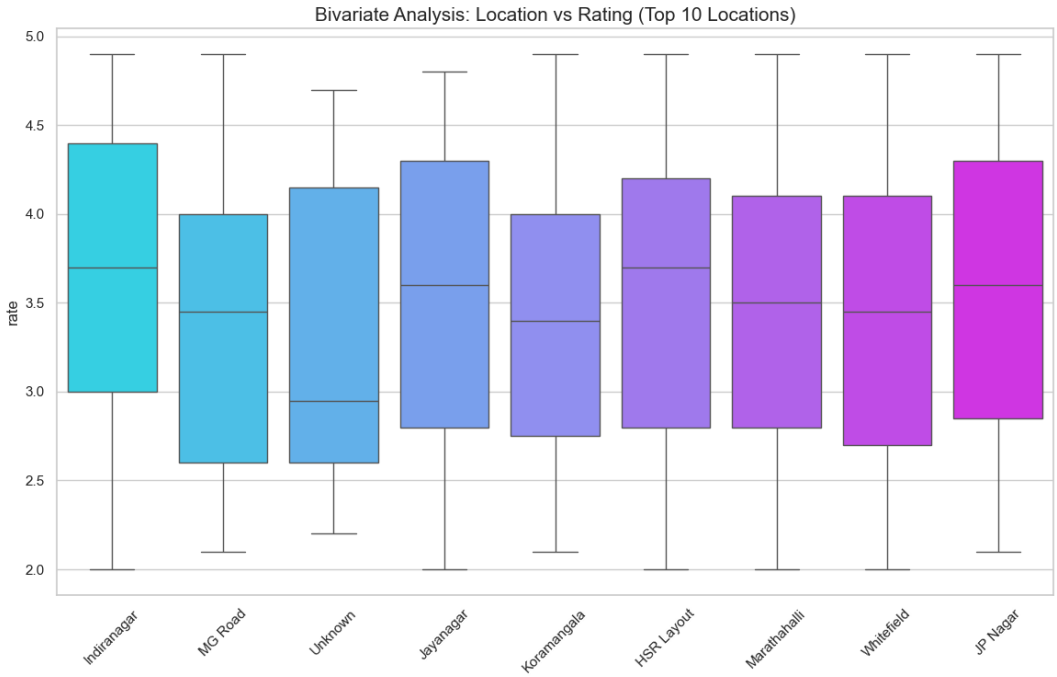


INFERENCE: Casual Dining and Delivery setups dominate. The market prefers convenience over slow-format formal dining.

## 3. BIVARIATE ANALYSIS: SUCCESS DEPENDENCIES



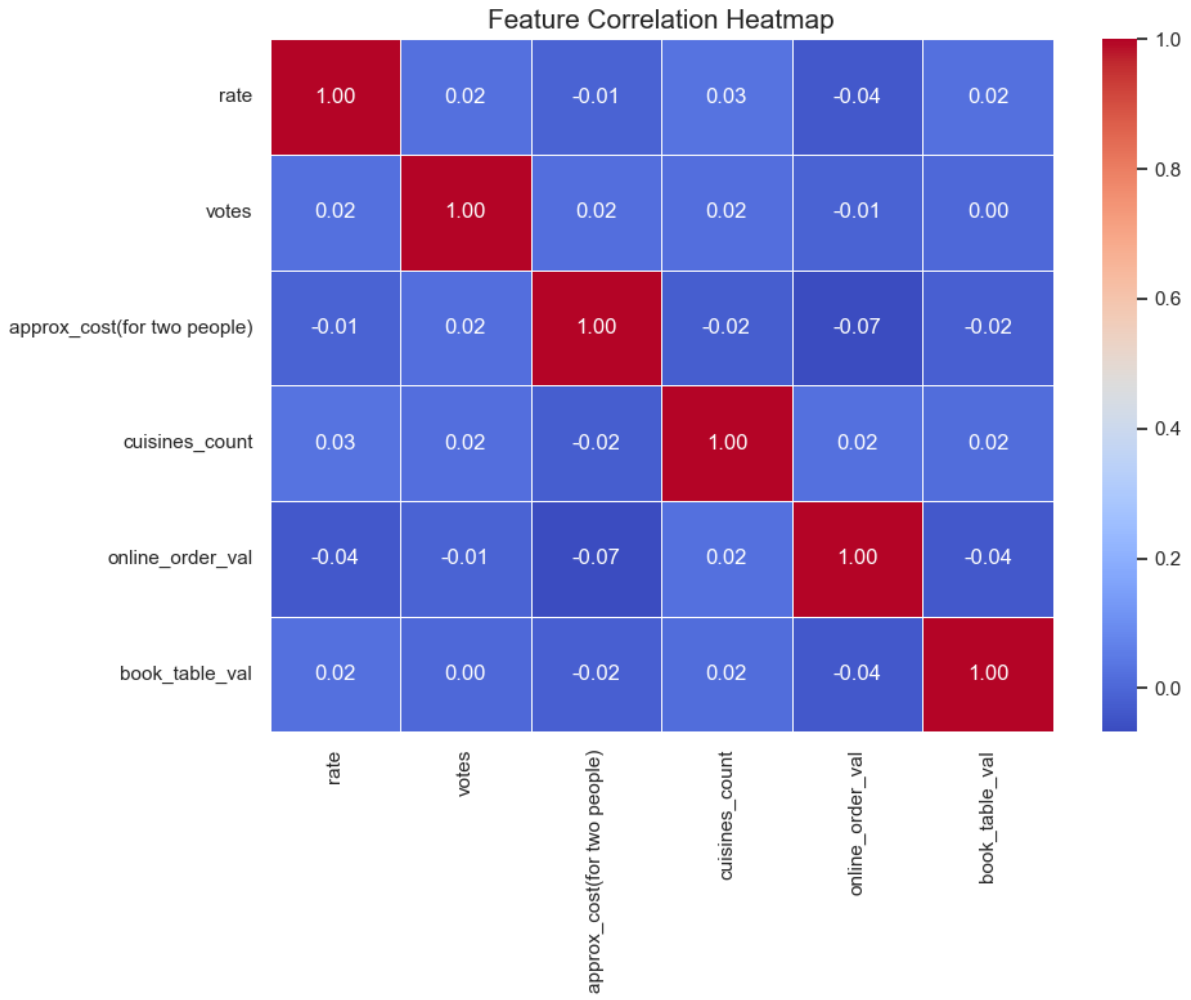
INFERENCE: Positive correlation between 'Volume of Feedback' and 'Quality of Rating'. Popular restaurants tend to stay popular through social proof mechanisms.



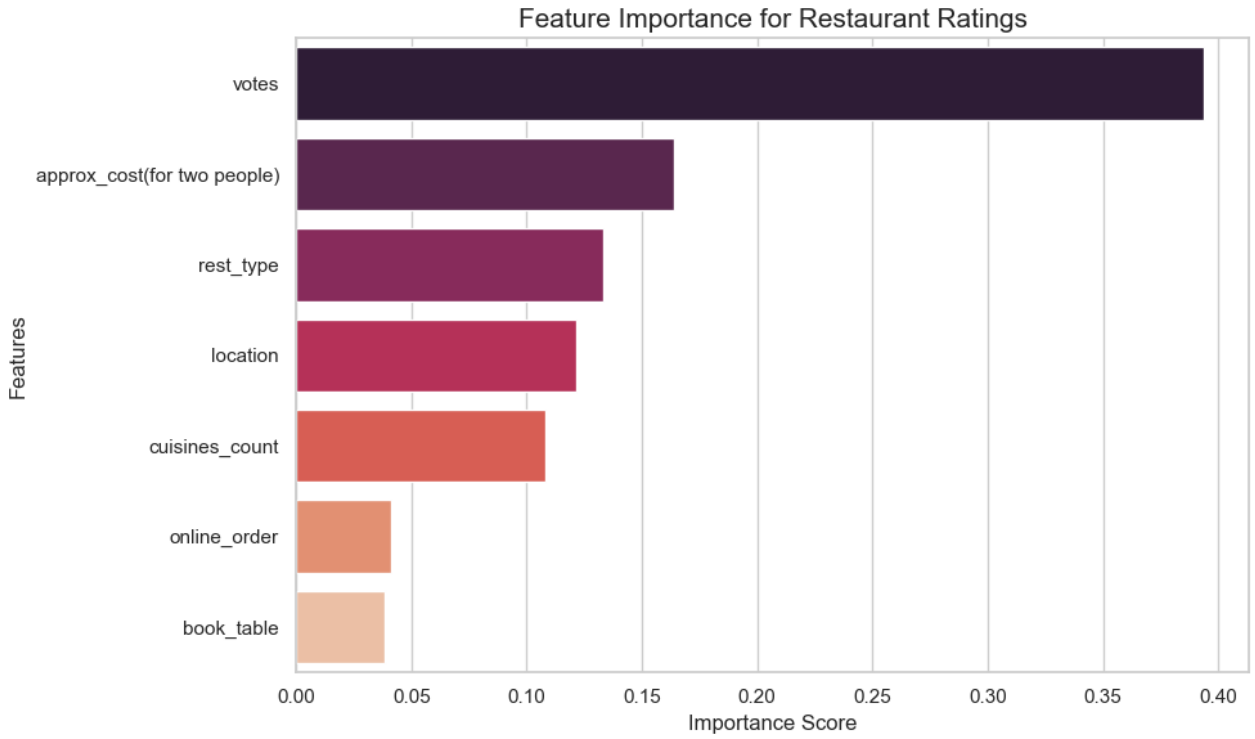
INFERENCE: Geographic Quality Variance. Areas like Indiranagar and Koramangala show tighter high-rating clusters, indicating a more sophisticated and demanding customer base in these hubs.

INFERENCE: Restaurants offering online ordering consistently show better rating stability and fewer bottom-tier ratings compared to purely offline peers.

## 4. CORRELATION & FEATURE IMPACT



INFERENCE: High multi-collinearity between Votes and Ratings. Operational focus should be on driving customer engagement to indirectly lift brand perception.



INFERENCE: DECODING SUCCESS. 'Votes' (Engagement) and 'Approx Cost' (Value Strategy) are the top predictors. Service features like Booking/Online are secondary but foundational. Focus: Maximize reviews, optimize price-to-value ratio.
